

# AR005 Tall Throttle Bracket Kit

This throttle bracket kit provides proper alignment for a stock type throttle cable on a high rise single carb manifold such as the Indy 440-3 or the Edelbrock Super victor intake. This kit will work with a spacer that is up to one inch tall.

These kits are designed for the larger 4500 series Dominator type carb as pictured above but they will also fit the smaller 4150 series carb or even an Edelbrock or Carter.

We recommend using the tall AR119 throttle return spring kit as shown above. Adjust the throttle cable per the service manual. If your throttle cable is too short, you might order one for a car equipped with a slant six as those had longer cables.

The mechanical kickdown linkage that the factory used cannot be adapted to this style of throttle bracket, but this throttle bracket will accommodate a cable kickdown. Two location holes for the cable kickdown are provided on the throttle bracket.
