

AR134MM Throttle Linkage Kit for Indy ModMan

This throttle linkage kit is designed to work with Edelbrock Performer style carburetors on the Indy ModMan dual 4bbl intake. The linkage kit uses Heim joints on each end to avoid binding and to allow maximum adjustability.

The kit includes the throttle bracket, throttle stud, throttle linkage rod with Heim ends and the throttle return bracket with a dual stainless steel spring.

Install the throttle linkage as shown in the picture. Adjust the throttle cable per the service manual instructions. This linkage kit was designed to work with the factory throttle cable, but other types may also work. Note that the Heim ends fit into the large holes at the top of the Edelbrock throttle levers, while the throttle stud fits into the next hole down on the lever. This hole will have to be reamed slightly larger on some of the newer Edelbrock carbs before the throttle stud will fit properly.

With both carburetors properly set at idle position, adjust the Heim ends until the linkage slips into the carburetor throttle brackets. Verify that both carburetors pull to wide open throttle at the same time. Once the linkage is properly adjusted, tighten the jam nuts to prevent any further movement.
